# Mechanical temperature switches

## Introduction

### Construction

### Ambient temperature compensation and switching accuracy

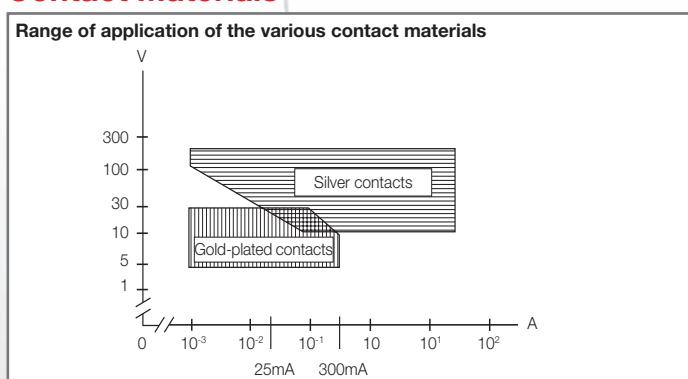

The accuracy of liquid-filled temperature switches depends largely on the ambient temperature. Barksdale temperature switches incorporate a compensating device to cancel out the adverse effects of ambient temperature fluctuation. Within the mid 60% of the adjustable range (between 20% and 80% of the scale area) the influence of the ambient temperature is limited to  $\pm 0.5\%$  ( $\pm 2\%$  at minimum or maximum adjustable set point).

#### Example:

In conventional switches an ambient temperature fluctuation between  $-50^{\circ}\text{C}$  and  $+75^{\circ}\text{C}$  produces a swing of 10 degrees or more - in Barksdale switches extreme fluctuation of ambient temperatures may result in a 2 to 3 degrees swing.

### Contact Materials

Barksdale temperature switches have silver contact micro switches. On request we also supply micro switches with gold-plated contacts. Gold-plated contacts are almost exclusively used on micro switches that are only exposed to low electrical loads.

The product of current and voltage should not exceed 0.12 VA. Recommended values: current should range at  $< 400\text{ mA}$  and voltage at  $< 30\text{ V}$ . If operated on alternating current the above values are peak values.
